

Test-tube babies, also known as in vitro fertilization (IVF), raises a number of ethical issues. One concern is that the procedure involves the creation of multiple embryos, but only one is typically implanted in the mother's uterus. This can result in the disposal of surplus embryos, which some people consider to be a form of embryonic destruction. Another ethical concern is that IVF can be expensive and not accessible to everyone, leading to potential issues of inequality. Additionally, there is a potential for misuse of the technology, such as using it to create designer babies or to select for certain traits.
